

Project Design Phase

Problem – Solution Fit Template

Date	27 June 2025
Team ID	LTVIP2025TMID41045
Project Name	Smart Sorting: Transfer Learning for Identifying rotten fruits and vegetables
Maximum Marks	2 Marks

Problem – Solution Fit Template:

1. Problem:

In the agricultural and food supply chain, identifying and sorting rotten fruits and vegetables remains a major challenge. Manual inspection is time-consuming, labor-intensive, and prone to human error, leading to inefficiencies in quality control. Moreover, the lack of scalable and automated solutions results in food waste, increased operational costs, and compromised customer satisfaction across factories, supermarkets, and households.

2. Target Group / Customers:

- Food processing industries
- Supermarket quality control teams
- Tech-savvy consumers using smart kitchen appliances
- Agri-tech solution providers

3. Existing Alternatives:

- Manual sorting of produce by workers in processing plants
- Visual inspections by supermarket staff at receiving docks
- Expiry-date tracking in smart refrigerators
- Basic rule-based computer vision tools

4. Problems With Existing Alternatives:

- Inaccuracy due to human fatigue and inconsistency
- Lack of real-time detection and automated sorting
- Spoilage detection not based on actual visual condition
- Not scalable or adaptable to different produce types

5. Solution:

An AI-powered smart sorting system using transfer learning (based on pre-trained models like VGG16) that detects rotten fruits and vegetables through real-time image classification. The system can be integrated into conveyor belts, supermarket intake docks, or smart refrigerators. It classifies produce as fresh or rotten and enables automated sorting, alerting, or discarding — thereby reducing waste, improving efficiency, and enhancing freshness assurance.

Purpose:

1. **Automate Quality Control:** Eliminate manual inspection with intelligent image-based detection.
2. **Enhance Sorting Accuracy:** Use transfer learning models to reliably distinguish rotten produce.
3. **Minimize Food Waste:** Detect spoilage early across industrial and domestic environments.
4. **Support Retail Freshness:** Improve inventory decisions in supermarkets through realtime feedback.
5. **Promote Smart Living:** Enable households to monitor stored produce and act before spoilage.
6. **Scalable AI Integration:** Provide a flexible, low-cost solution adaptable to various settings and produce types.

Problem-Solution Fit:
